annotation	<p>documentation</p> <p>A surface face. It contains a space delimited list of "id" references for 3 (TIN) or 4 (grid) surface "P" points.</p> <p>documentation</p> <p>The 3 or 4 numbers represent the vertices on the face. Each number is a reference to the ID value of a surface point "P" for the face coordinates.</p> <p>documentation</p> <p>Attribute "i" is optional, where a value of "1" indicating the face is part of the triangulation but is invisible.</p> <p>Attribute "n" is optional, space delimited face index values indicating the adjacent face index for each face edge, where a value of "0" (an invalid face index value) indicates the edge has NO neighboring face. The face index value is implied and defined from 1 to n number of F elements in a single Faces collection.</p> <p>Example:</p> <pre><!-- <Faces> <F>5 10 20</F> Implied face index = 1 <F>5 10 20</F> Implied face index = 2 <F>5 10 20</F> Implied face index = 3 <F n="2 0 3" i="1">10 20 30</F> Implied face index = 4 ... </Faces> --></pre> <p>Where 2 is the neighboring face index for the edge 10 to 20, 0 means no neighbor between 20 and 30 and 3 is the neighbor index for 30 to 10.</p> <p>Attribute "b" is used to indicate the edges of the face that coincide with breakline data.</p> <p>b=an integer bitmask sum of the sides of the face that had breaklines in the original data.</p> <p>This gives a valid integer range of 0 to 7 for each TIN face:</p> <p>1 = side 1 2 = side 2 4 = side 3</p>					

For example b="5" has breakline data on TIN face sides 1 and 3.

source

```
<xs:element name="F">
  <xs:annotation>
    <xs:documentation>A surface face. It contains a space delimited list of "id" references for 3 (TIN) or
4 (grid) surface "P" points. </xs:documentation>
    <xs:documentation>The 3 or 4 numbers represent the vertices on the face. Each number is a
reference to the ID value of a surface point "P" for the face coordinates.</xs:documentation>
    <xs:documentation>
Attribute "i" is optional, where a value of "1" indicating the face is part of the triangulation but is
invisible.
Attribute "n" is optional, space delimited face index values indicating the adjacent face index for each
face edge, where a value of "0" (an invalid face index value) indicates the edge has NO neighboring
face. The face index value is implied and defined from 1 to n number of F elements in a single Faces
collection.
Example:
<!--
<Faces>
  <F>5 10 20</F>  Implied face index = 1
  <F>5 10 20</F>  Implied face index = 2
  <F>5 10 20</F>  Implied face index = 3
  <F n="2 0 3" i="1">10 20 30</F>  Implied face index = 4
  ...
</Faces>
-->
```

Where 2 is the neighboring face index for the edge 10 to 20, 0 means no neighbor between 20 and 30 and 3 is the neighbor index for 30 to 10.

Attribute "b" is used to indicate the edges of the face that coincide with breakline data.

b=an integer bitmask sum of the sides of the face that had breaklines in the original data.
This gives a valid integer range of 0 to 7 for each TIN face:

1 = side 1
2 = side 2
4 = side 3

For example b="5" has breakline data on TIN face sides 1 and 3.

```

element **ZoneMaterial**

diagram	 A diagram placeholder for the ZoneMaterial element. It consists of a rectangular box with a thin black border. In the top-left corner of the box, there is a small red square icon containing a white 'X', followed by the text 'LandXML-1.2Doc_p207.png'.

<!-- FDOT SURVEY ADDITIONS -->
<!-- FDOT notes on RawObservations additions

```

Where:

alignRef is the name of the alignment.

alignStationName is the station value where the rod reading is taken.

alignOffset is the signed (+/-) distance from the CL of the referenced alignment.

3-wire level loop attributes:

upperStadia is the upper stadia hair rod reading.

rod is the middle hair rod reading.

lowerStadia is the lower stadia hair rod reading.

circlePositionSet represents the position of the reading circle.

This optional attribute (assumed to be "1.0"), unless multiple reading circle positions were present from the same setup record.

'unused' = boolean attribute to indicate the record is not used.

'directFace' = indicates the scope is flipped – true if the scope is not flipped, false if it is. -->

<!-- coordGeomRefs identifies one or more 'name' values that link to specific <Line>, <Curve>, <Spiral> or <IrregularLine> in a <CoordGeom> element. This allows linking an survey observation to specific <Parcel>.<CoordGeom> based geometry. -->
